SlipFlow

Marketplace orders. Reviewed production slips.

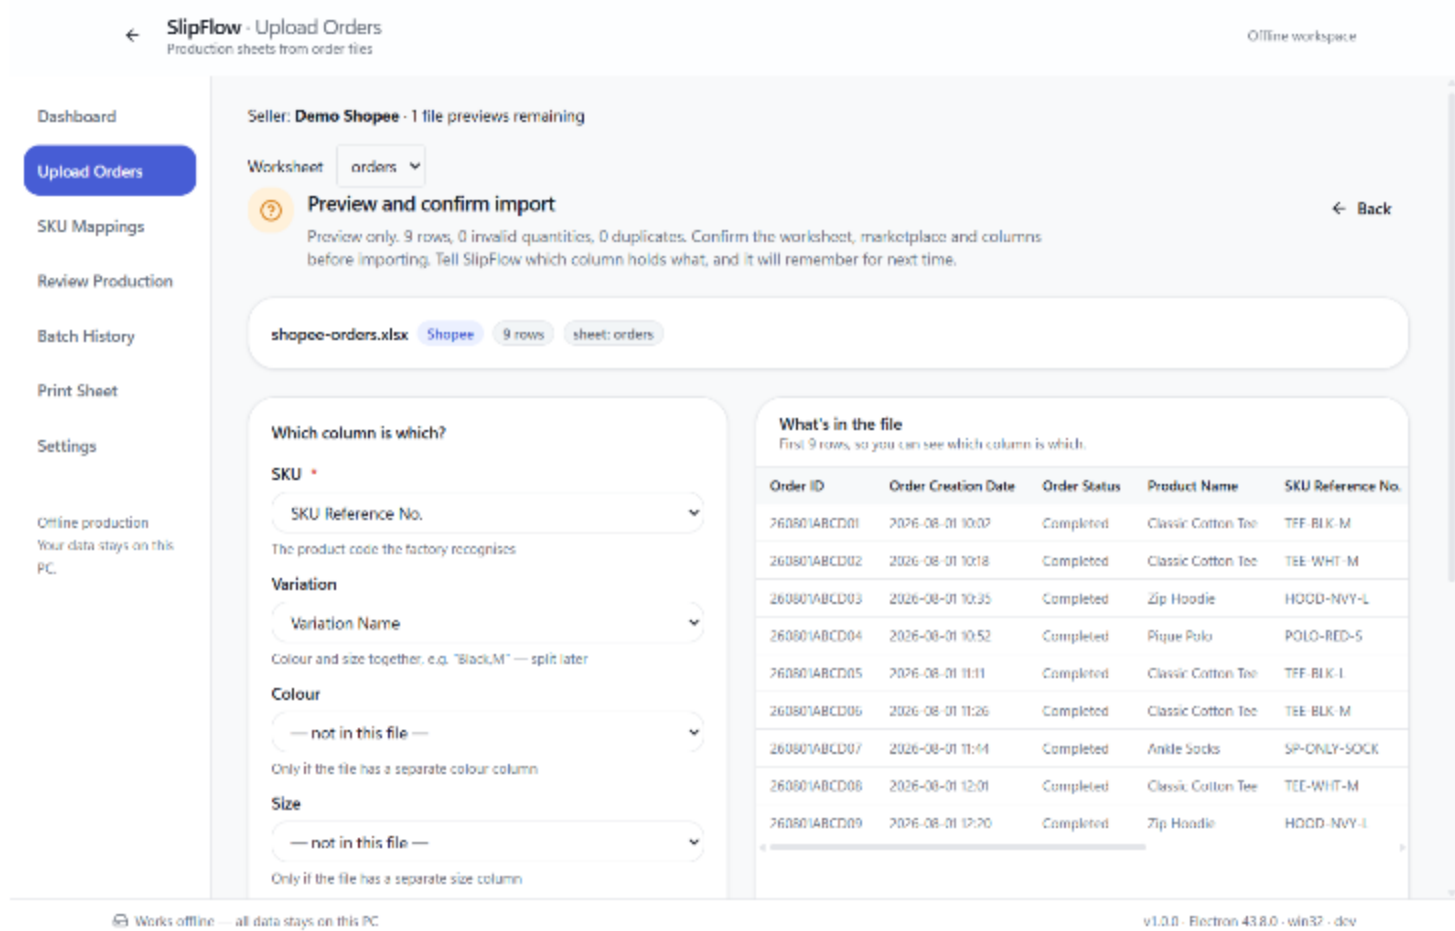

Offline Windows desktop application

The manufacturing problem

An order export is not yet a production instruction.

Staff must identify the product, interpret its variant and reconcile quantities before sewing starts.

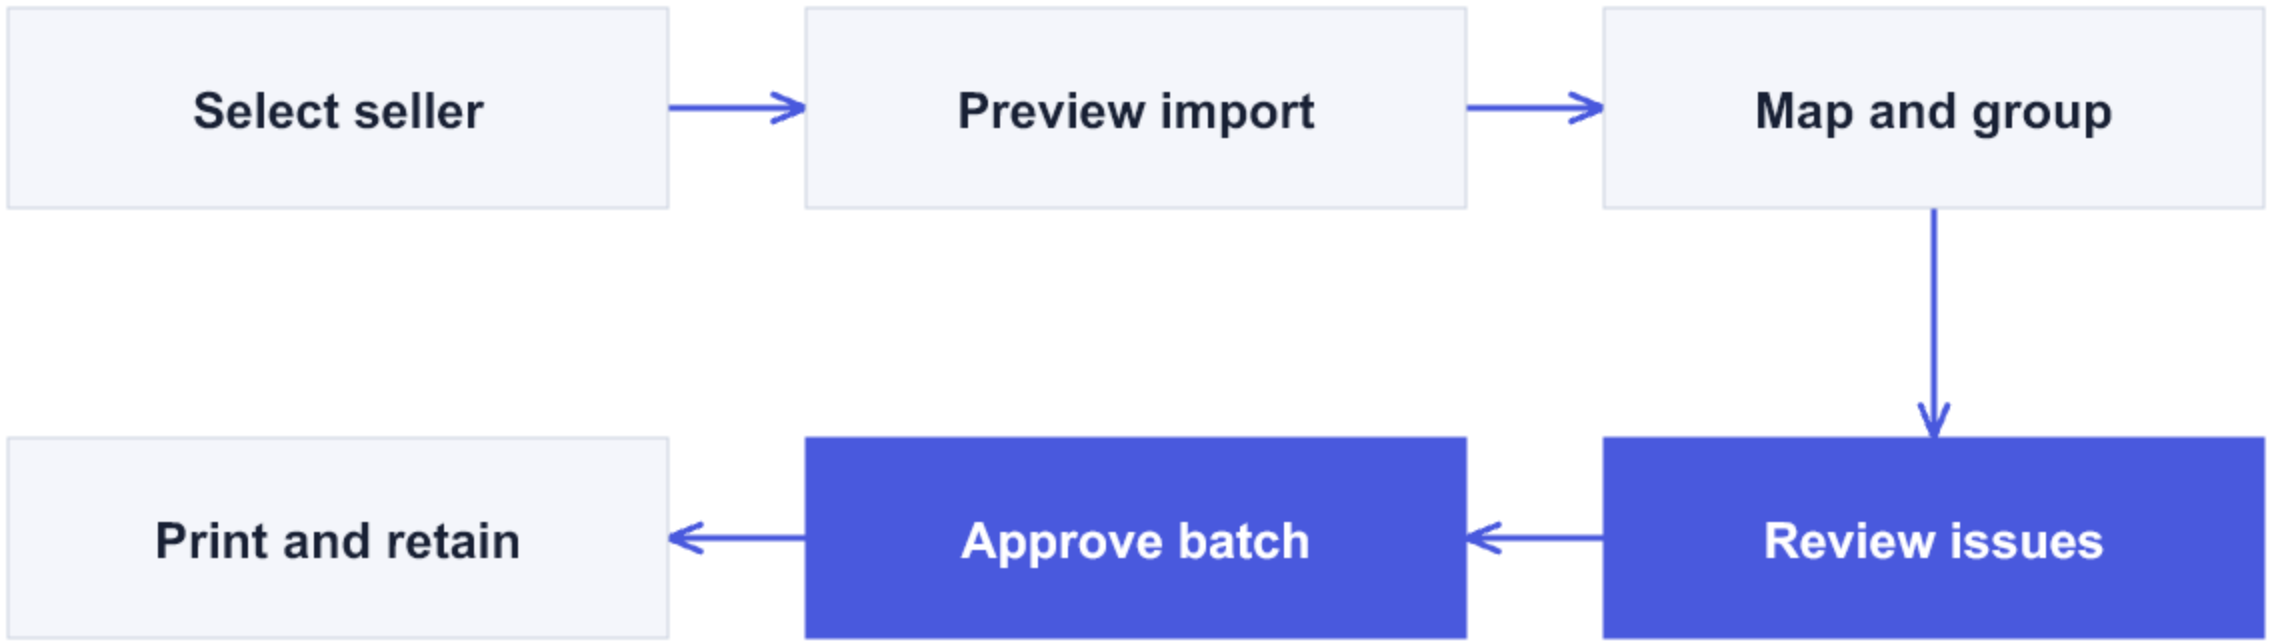

The manual workflow

A repeated file or a misread quantity can change what the factory produces.

The design priority is traceable, accurate quantities.

The SlipFlow workflow

Operator approval is a required step before production output.

Objectives and functional scope

INPUT

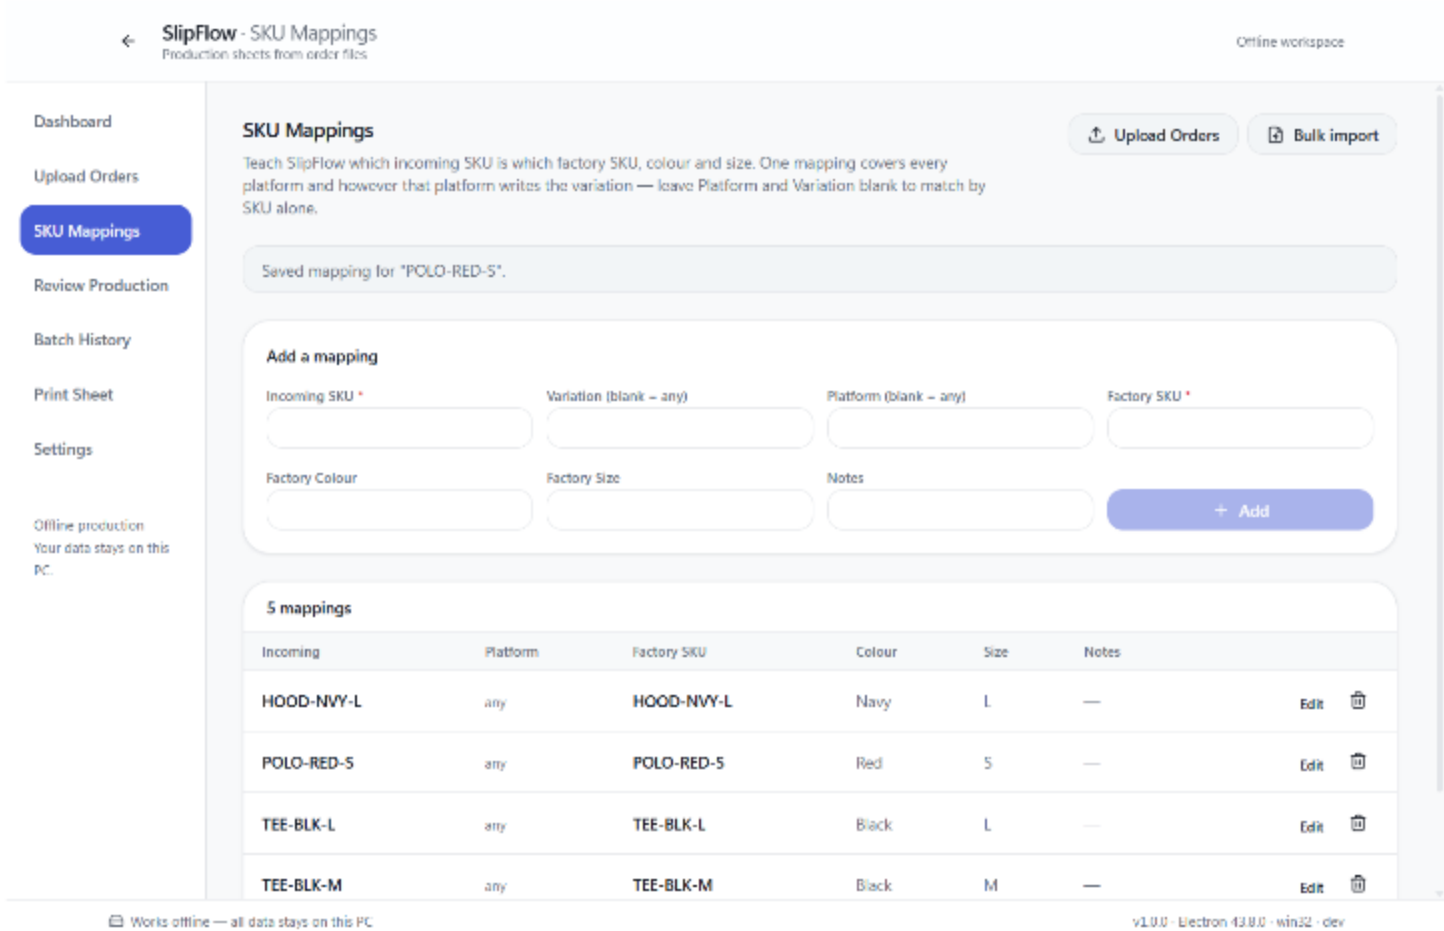

Marketplace exports
CSV, XLS and XLSX
Seller account identity
Explicit SKU mappings

OUTPUT

Reviewed batch quantities
Readable A4 tailor slips
PDF and native printing
History and recovery copies

Local SQLite storage. No server or marketplace credentials required.

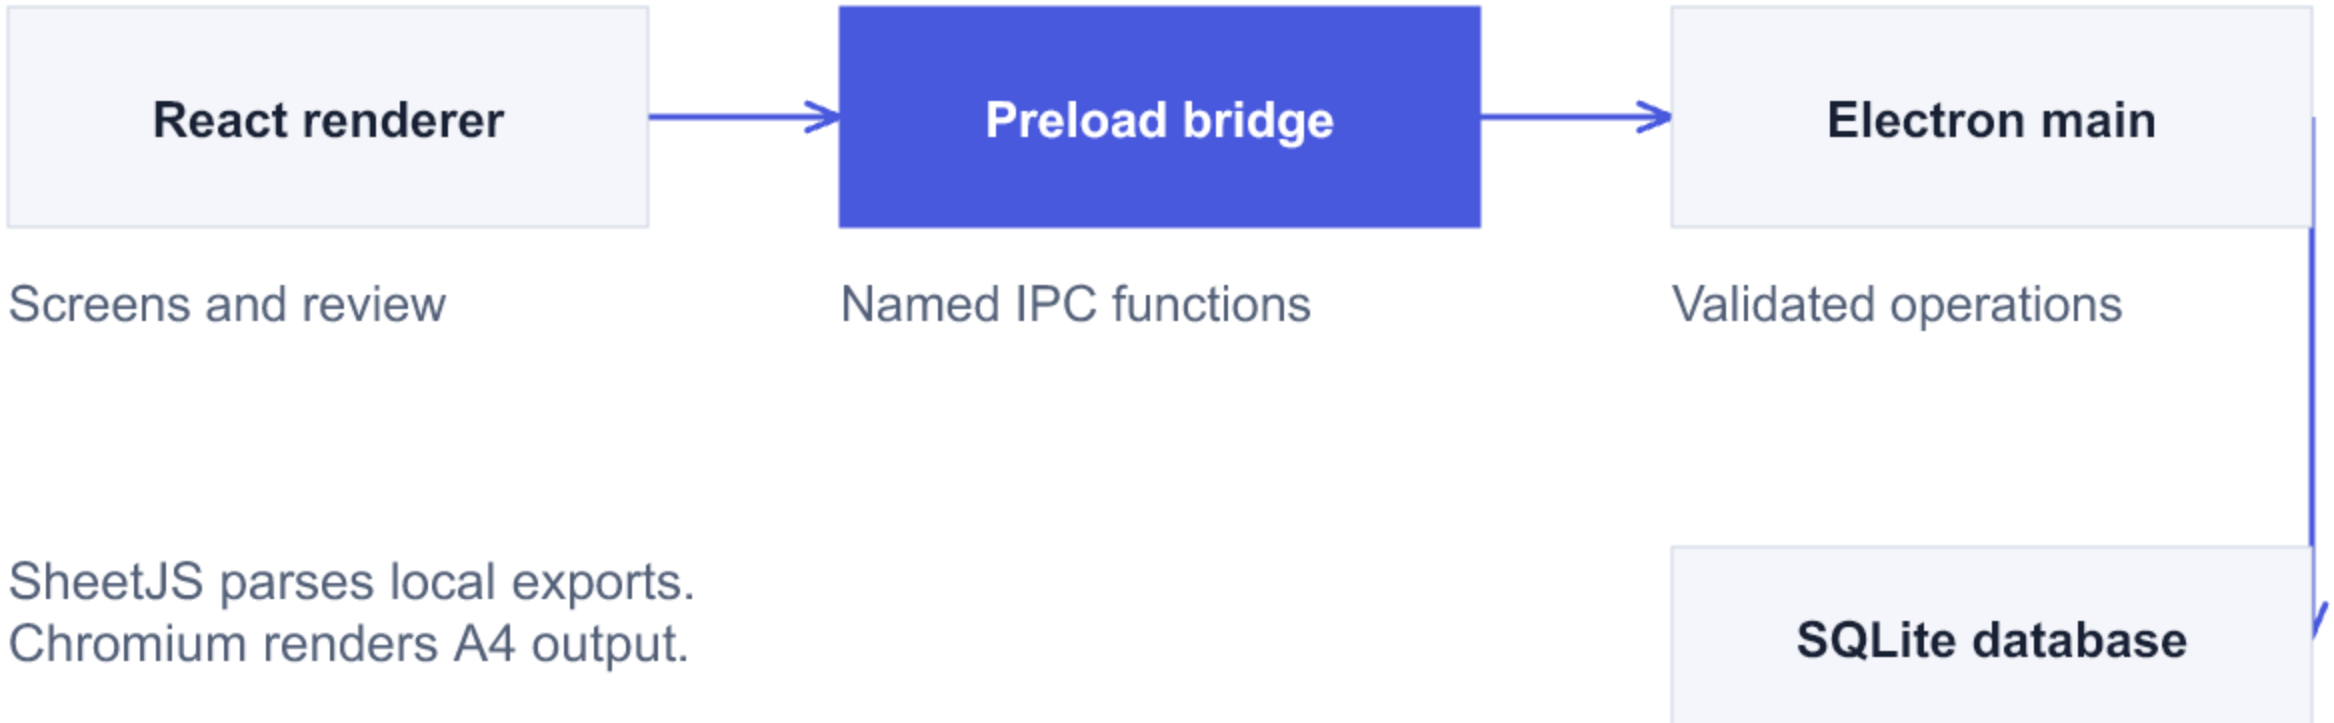

Main features

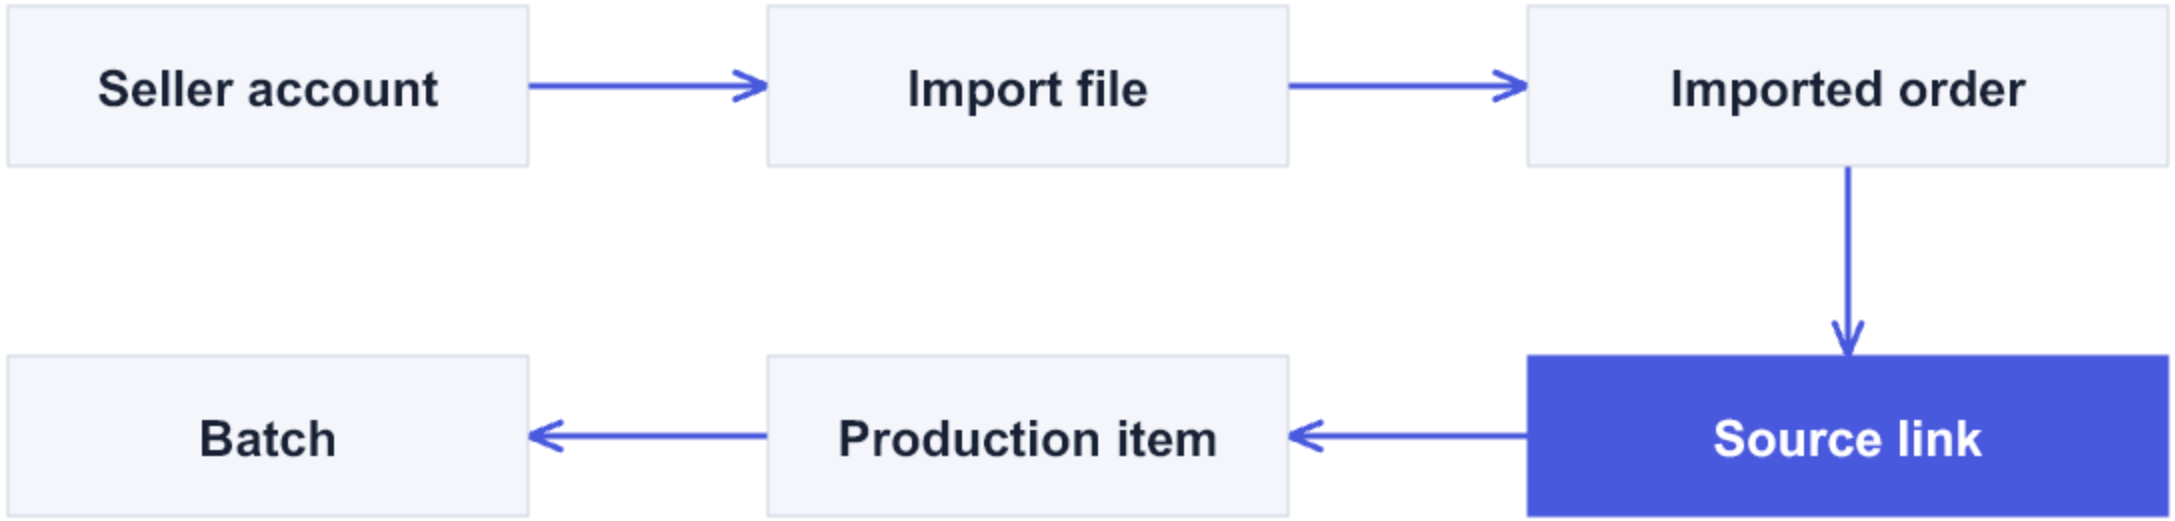

Explicit mappings

Variant review
Duplicate control
Batch history
Verified recovery

Application architecture

Source records remain traceable

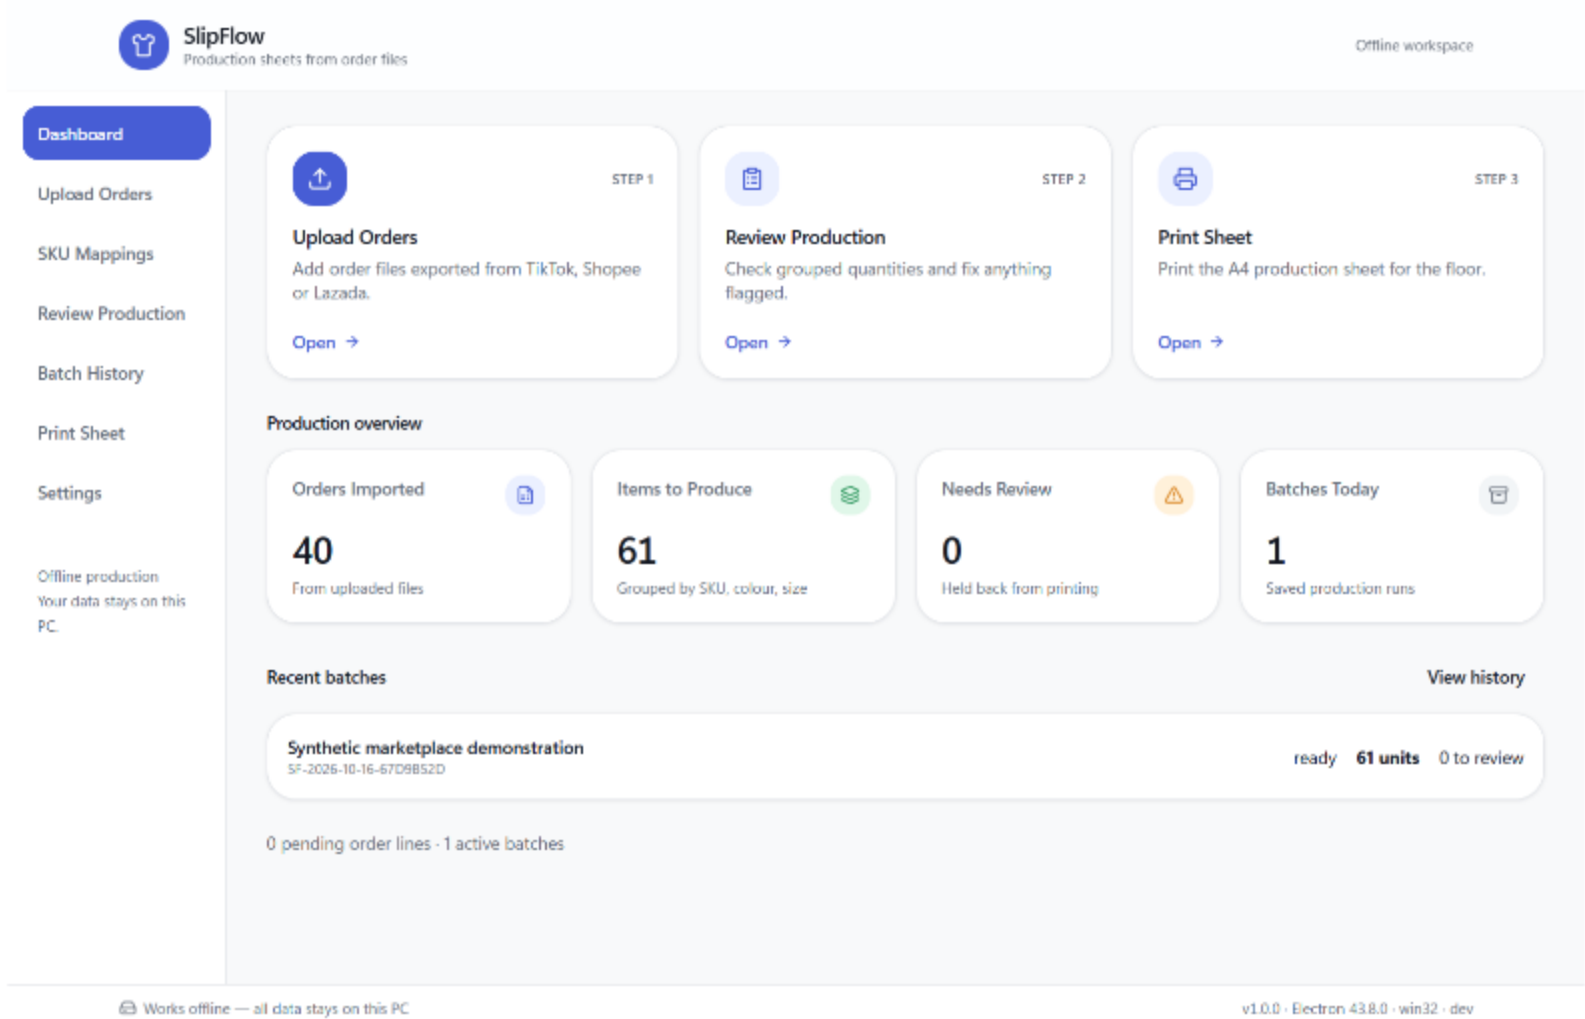

28 original order lines

12 repeated rows excluded

61

reconciled production units

The working application

40 imported rows

12 duplicates excluded

61 units ready

Testing, reliability and security

96

automated verification checks

Quantity and duplicate regressions
Transactional imports and grouping
Verified backup and restoration
A4 and multi-page PDF generation
Sandboxed renderer and validated IPC

2 Electron UI scenarios

Synthetic data on Windows 11

Limits and next validation

Validate in the factory

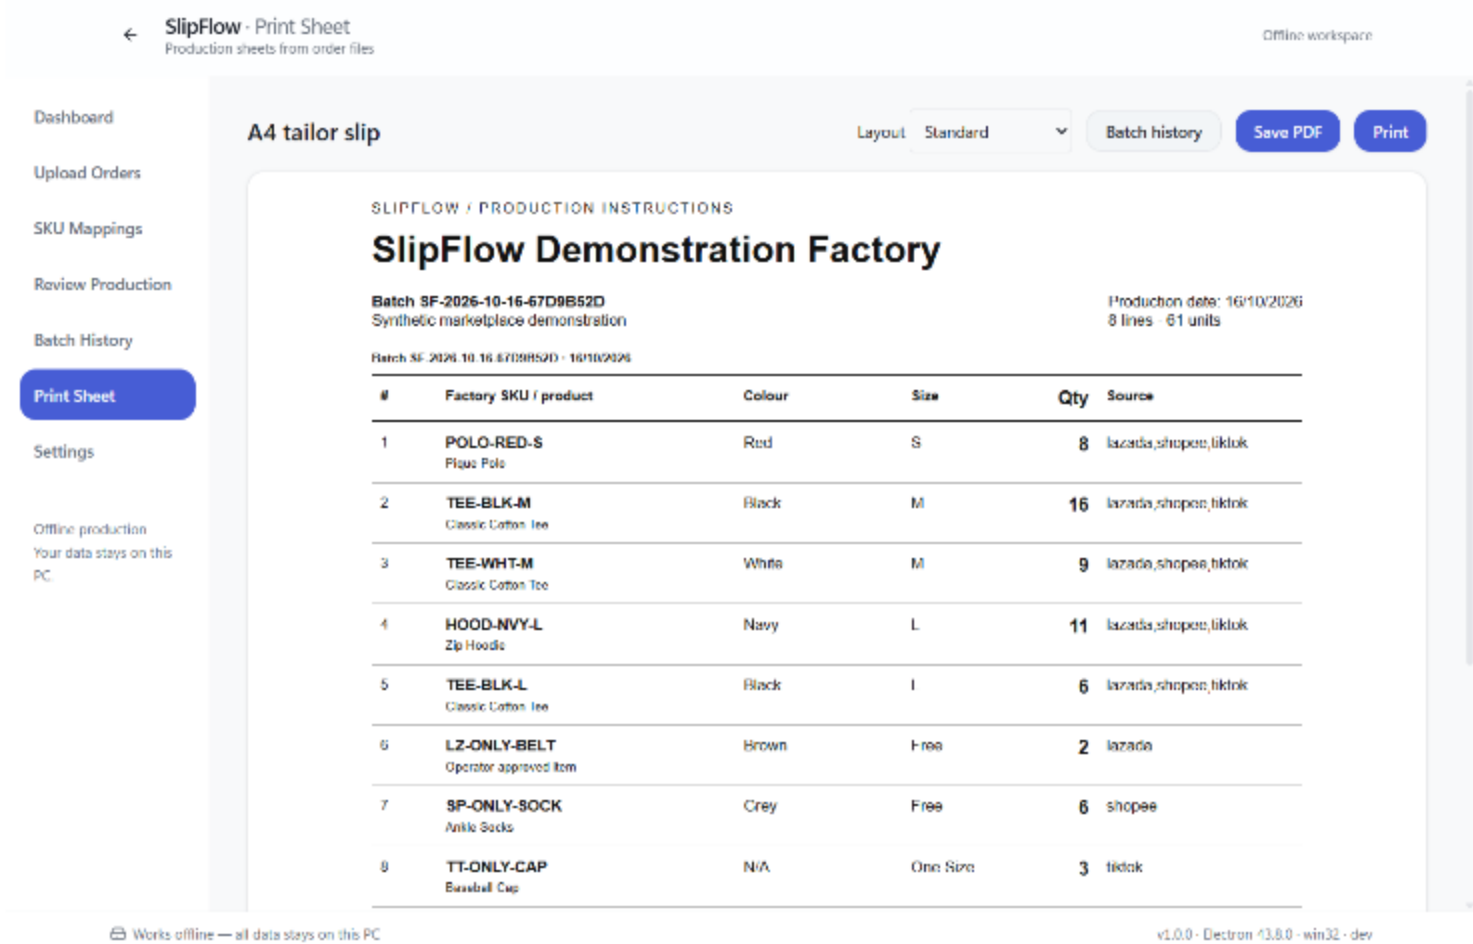

Live export formats
Physical printers
Operator usability
Measured before-and-after workflow

Next development

Signed Windows distribution
More anonymized fixtures
Factory pilot feedback
Broader compatibility testing

No live API integration or verified factory time-saving claim.

Demonstration

Import a sample
Resolve one issue
Approve 61 units
Export the tailor slip
Reopen and restore
